PHP and Tomcat

Last modified: 10/25/2004

What follows is a little howto to get php to work inside Tomcat on Windows (tested with Php 4.3.6 and Tomcat 4.1.30 (I just did what is currently detailed at http://wiki.apache.org/jakarta-tomcat/UsingPhp)
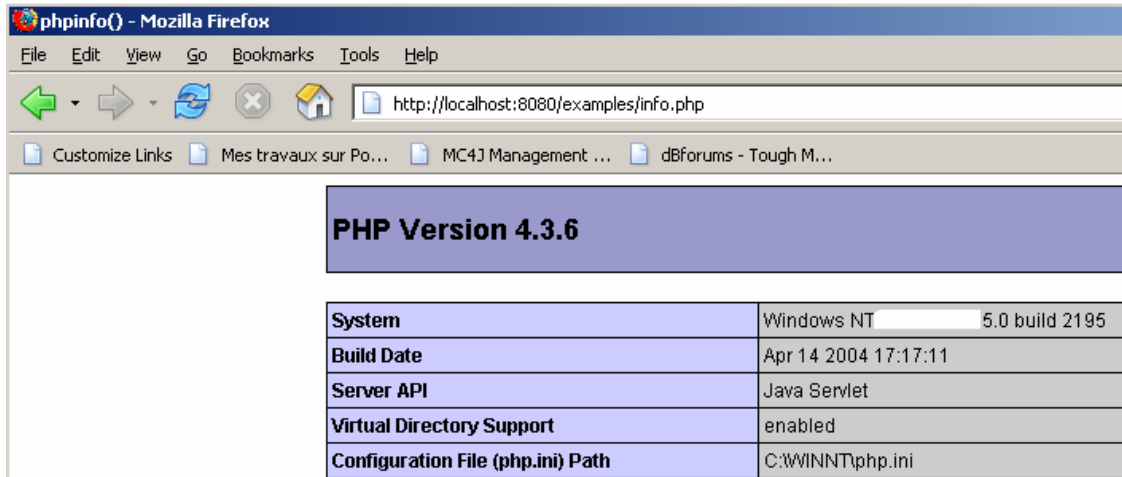

1. Copy **phpsvlt.jar** to your CATALINA_HOME\common\lib
2. Copy **phpsvlt.dll** to c:\WINNT\system32
3. To use php in your webapp add this lines to webappname\WEB-INF\web.xml:
    a. This in the servlet declaration part:

    ```
    <servlet>
     <servlet-name>php</servlet-name>
     <servlet-class>net.php.servlet</servlet-class>
    </servlet>
    <servlet>
     <servlet-name>php-formatter</servlet-name>
     <servlet-class>net.php.formatter</servlet-class>
    </servlet>
    ```

    b. This in the servlet mapping declaration part:

    ```
    <servlet-mapping>
     <servlet-name>php</servlet-name>
     <url-pattern>*.php</url-pattern>
    </servlet-mapping>
    <servlet-mapping>
     <servlet-name>php-formatter</servlet-name>
     <url-pattern>*.phps</url-pattern>
    </servlet-mapping>
    ```
4. I used the "examples" webapp and I put the following files into webapps\examples\ folder:
    a. Info.php (with just one line in it: <?php phpinfo(); ?>)
    b. Info.phps (the same, just change name)
5. The result of running them is:

And:

Note that this seem to conflict with Php's java extension, which I had to unload!!!
