FROM ANALOG TO DIGITAL AGE

- **D igital:** Any system based on discontinuous data or events.
- **For com puter:** C om m unications signals or inform ation represented in a two-state way using electronic or electrom agnetic signals.(0s and 1s).
- **Anabg:** Continuous data varying in strength & quality. e.g: sound ,light,tem perature and others.
- **W hy we use digital instead of analog?**

*

1.2

PURPOSE OF MODEM:

- **M odem** is short for M ODULATE/ DEM ODULATE.
- **D igital** \longrightarrow **anabg** = M odulate
- **Anabg** \longrightarrow **digital** = Dem odulate
- **O ur voice is analog.** W hen we record using tape recorder, our analog voice w ill be recorded into tape. W hen we copy the voice to the com puter, our analog voice w ill be converted into digital one. This is done by using sound card in the system unit.

THE PRACTICAL USES OF COMMUNICATIONS

- Many forms of connectivity:
 1. Videoconferencing & Videophones
 2. Workgroup computing & groupware
 3. Telecommuting & virtual offices
 4. Home networks
 5. Smart Television

*

1. Videoconferencing & Videophones

- **Or Teleconferencing**, is the use of television video & sound technology as well as computer networks to enable people in different locations to see, hear & talk with one another.
- 2 types of videoconferencing:
 - i. **Point-to-point**: is a two-person system. They communicate to each other.
 - ii. **Multipoint**: Allows three or more participants in different locations.

*

2. Workgroup Computing & Groupware

- **Workgroup computing/ Collaborative computing**: teams of co-workers at different sites/ places use networks of microcomputers to share info. & to cooperate on projects.
- **Groupware**: It is software that allows two or more people on a network to work on the same info. at the same time. E.g. Lotus Notes and MS NetMeeting (supports videoconferencing).

*

3. Telecommuting & Virtual Offices

- Telecommuting: Working at home or on the road while in telecommunication with the office. (The concept of SOHO)
- Benefits: Reduced traffic congestion, energy consumption & air pollution, increase productivity (reduce tension), reduce absenteeism.
- Disadvantages: Isolated, difficult to measure employee's productivity.
- Virtual Offices: Nonpermanent & mobile office run with computer & communications technology.
- They have no physical office but virtual office. They use pocket pagers, portable comp. & others for communications.

*

4. Home Networks

- The existence of LAN will lead to the next development which is the networking of home appliances, linking stereos, lights & others that can receive comm and using voice. E.g. Using voice comm and to turn on the lights or bring up music (Smart Home)

*

5. Smart Television: DTV, HDTV, SDTV

- 3 groups to TV:
 - i. Interactive TV: Allows us to interact with the show we're watching. E.g. Requesting info. about a product or playing along with a game show.
 - ii. Personalized TV: Consists of hard-drive-equipped personal video recorders that allow us not only record shows but also pause, rewind and replay live TV programmes.
 - iii. Internet TV: Allows us to read internet text & web pages on our TV set.
- These 3 will probably come together in a single box known as "digital TV".

*

5. Smart Television: DTV,HDTV,SDTV

1. **D igital TV** : U ses a digital signal, or series of 0s and 1s. It is m uch clearer & less prone to interference than analog TV .
2. **H igh-definition TV (HDTV)** : It works with digital broadcasting signals & has a wider screen & higher resolution than standard TV .HDTV display screen has 10 tim es more pixels on a screen - 1920 x 1080 pixels or more .
3. **Standard-definition TV (SDTV)** :H as a lower resolution and a picture quality sim ilar to that required to watch DVD movies .

COMMUNICATIONS MEDIA & TRANSFER RATES

- Com m .m edia carry signals over a communications path, the route between 2 or more com m .m edia devices.
- Speed , data transfer rate & how m uch data can be sent by a signal depend on what type of m edia and signal that we use.

*

Wired Communications Media

- 3 types of wired com m .m edia:
1. **Tw isted-pair wire** : consists of two strands of insulated copper wire, tw isted around each other. It reduce interference (crosstalk) from electrical fields.
 - It is slow & does not protect well against electrical interference but since it has been used since 20-30 years ago, it still no doubt be used for years to come.
 2. **Coaxial cable** : consists of insulated copper wire wrapped in a solid metal shield & then in an external plastic cover.
 - Widely used for cable TV & cable internet connection.
 - It can carry voice & data at faster rate (up to 200 M bits/second) compared to tw isted-pair wire.
 3. **Fiber-optic cable** : consists of hundreds of thin strands of glass or plastic that transmit pulsating beams of light rather than electricity.
 - As thin as human hair, can transmit up to 2 Gbits/second.
 - It is lighter & more durable and more secure compared to the other two.

Wireless Communication Media

- 2 types of wireless media:
1. Microwave radio: transmits voice & data at 45 M bits/second through the atmosphere as superhigh-frequency radio waves in microwaves.
 - It is line-of-sight; they cannot bend around corners or around the earth's curvature. So, they need microwave stations to be placed 25-30 miles of each other without any obstruction in between.
 2. Communications satellites: are microwave relay stations in orbit around the earth.
 - It transmits a signal from a ground station to a satellite (uplinking) and the reverse process is downlinking.
 - The major problem of satellite is the bad weather can sometimes block the data flow from the satellite to the ground.

SHORT-RANGE WIRELESS COMMUNICATION

- 2 types of short-range wireless communication:
1. Bluetooth: is a short-range wireless digital standard aimed at linking cellphones, PDAs, computers & peripherals up to 30 feet.
 - it replaces cables connecting PCs to printers & PDAs
 - It is more comfortable compared to local high-speed connections such as USB because it does not use cable or wire.

1.17

*

© Prentice Hall 2002

SHORT-RANGE WIRELESS COMMUNICATION

1. WiFi: short for Wireless fidelity - is a short-range wireless digital standard aimed at helping portable computers to communicate at high speeds & share internet connections at distances up to 300 feet.
 - Inside offices, airports & internet cafe.
 - It is cheaper and 10 times faster than Bluetooth.
 - Supported by Windows XP & most of the today's computers.

1.18

*

NETWORK

- Also known as communications network: is a system of interconnected computers, telephones or other comm. devices that can communicate with one another & share applications & data.
- Benefits of network:
 - i. Sharing of peripheral devices
 - ii. Sharing of programs & data
 - iii. Better communications
 - iv. Security of information
 - v. Access to DB

*

1.19

TYPES OF NETWORKS

1. Wide Area Network: A communications network that covers a wide geographic area such as a country or the world.
2. Metropolitan Area Network: A communication network covering a city or a suburb.
3. Local Area Network: Connects computers and devices in a limited geographic area such as one office, one building or a group of buildings close together.

*

1.20

© Prentice Hall 2002

TYPES OF LANs

1. Client/Server LANs: Consists of clients, which are microcomputers that request data & servers; which are computers used to supply data.
2. Peer-to-peer LANs: All microcomputers on the network communicate directly with one another without relying on the server.
 - Less expensive but slow down under heavy use.

*

1.21

© Prentice Hall 2002

INTRANETS, EXTRANETS & FIREWALLS

1. Intranets: An organization's internal private network that uses the infrastructure & standards of the internet & the web.
- Provide quicker access to internal info such as employee email address and telephone no., product info. and others.
2. Extranets: Private intranets that connect not only internal personnel but also selected suppliers & other strategic parties.
3. Firewalls: A system of h/w & s/w that blocks unauthorized users inside & outside the organization from entering the intranet.
