

Start “Configure your computer”.

In the Mandrakelinux Control Center, click on “System”, then on “Enable or disable the system services”.

The services screen lists services for your computer, their status, a button to show more information about the service, a box to select if you want the service to start on boot, and buttons to start and stop each service listed.

See the example below for the info button.

The last two buttons are shown to the right. It appears that pressing “Start” actually is more of a restart. Notice the notification popup after pressing either button.
