

About Viruses by Andrew

How Does It Work?

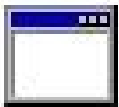

A virus attempts to infect files. It can either expand, append or insert itself into the file.

An program without viruses can look like this:

SOL

An program that's infected looks like this:

SOL

It may modify the registry. A good anti-virus program can prevent this.

Also it can unpack files from it.

New Viruses Come *Every Single Day*

And this is right. The 29/A group wrote lot of viruses.

The Platform They Can Invade

Good question. These “viruses” can spread under Windows.
