

The easy way to find agents quantity in cylinders

LLD - Liquid Level Detector

Why all the standards like NFPA 2001, NFPA 12, ISO 14520, etc. demand semi annually inspections of the agents quantity in the cylinders?

Why is it so difficult to do so in extinguishing systems?

Why doesn't the ultra sound liquid level detector give you the right result?

Why isn't the radioactive liquid level detector almost not used anymore?

Why nobody builds a light, portable and easy to use instrument that gives you immediately the weight of a liquid or an agent in a cylinder?

At least to the last question we have a good answer, please have a look at our site.
