

## THE EFFECT OF MAGNETIC VARIATIONS ON RADIONIC UNITS

Morris Bradley.

There is controversy about the use and value of Radionic Broadcast Therapy as a form of 'Alternative Care Therapy. These 'little black boxes', as they are often termed, are found all over the world, being used and abused. There are thousands of people who will vouch for the value of Radionic Treatment and will claim that the therapists were able to find and cure health problems, which had the orthodox medical profession baffled. The writer of this article has been involved with treatment and research into Radionics for a number of years and has formed the conclusion that when there is an apparent failure in the use of this equipment it can usually be levelled at the operator providing that the unit itself has been professionally designed and constructed.

We summarise some of the problems as follows:

1. Many radionic operators are self taught and do not understand the proper principles of radionics. They see an advertisement in some magazine, send away for the gear and operating handbook, and then go into business. They usually have a few successes but in general the failures outnumber the success rate, so consequently the unit and the practice get a bad name.
2. The next major problem is that many radionic operators work through the intellect in their analysis work and not through the sensitivity level. To be a successful operator one has to be a good dowser and be able to use a pendulum, aura-meter or similar piece of radiaesthetic equipment.
3. There can also be a problem with magnetic interference where some units are only designed to function correctly in the same hemisphere in which they were constructed. Usually when these machines are tested by orthodox scientists they do not understand the principles of radiaesthesia, nor the different types of power that drives these units. Most tests fail because of this and so the medical world is disapproving of such practices.

Radionics Research took a variety of machines, all run by different energy forces, and conducted a series of tests on these machines. There were the models which work on an electrically powered tuned integrated resistant circuit. There was the model which works on a magnetic motor, some that work on polar magnetic energy, and others that were energised by 'astral lines of force'. The first group, run off electric power or batteries, were the best with the fewest problems and easiest to use successfully. However, there was one principle that was dominant with all of the machines and this seems to be something that even the original designers overlooked. This was the lack of understanding of 'body polarity' for when this principle was not utilized or understood in radionic work, the end results were usually nil.

According to radionic and occult history the human body has seven energy vortices or centres associated with the endocrine gland sectors and these are mystically known as [chakras](#). Each chakra point absorbs energies out of the atmosphere and this enters the body through these vortices and supplies the vital life forces to the different sectors of the body.

The chakras relate to different sectors of the body, such as the heart, liver, the digestive system, and when there is a malfunction of any of these seven points it can indicate some form of health imbalance that needs attention.

The vortices when viewed with the psychic eye or checked by dowsing must always spin in a clockwise motion. In conjunction with this we have the Coil of Life, which is another energy field that revolves around the body aura, and this goes clockwise as well when the person is correctly **polarised**. If a person's witness is placed on a radionic machine for treatment and they have reverse body polarity they will not receive any benefit at all from the broadcast treatment, for when in this state they are throwing off energy and not absorbing it. This is one area where many radionic operators fail through not being able to identify correct body polarity in their clients.

If, for example, there are only two chakras spinning correctly in the patient while on treatment, then they will only absorb a small quantity of the radionic emission through those two points but this may be of little value for the body parts relating to these chakra points may be functioning correctly anyway, so nothing is gained. It seems to us that none of the manufacturers of radionic equipment fully understood the polarity principle so they incorporated alternative complimentary numbers that one could use, probably not realising that they 'sensed' these numbers but did not really understand the principle involved. We read it as, if the first number does no good (because your client has poor body polarity) then try the other number, the complimentary one. However, if the operator assures that the client is positively aligned, then there will be no need for the alternative rating.

In other units we tested, there was sufficient indication to show us that 'machines' that ran on magnetic (atmospheric) drive and were built in the northern hemisphere did not function correctly in the southern hemisphere. The unit that has a male to female treatment plate on them had to be reversed in the southern latitudes and the machines with the magnetic adjustments that pointed to North we found functioned better when aligned due South. One of our tests included the North-South treatment coil. In this test we found that the witness of the client responded better on one end if it was that of a male and better on the other end if it was that of a female. Here we made one end of the coil with a treatment plate and the other end with a witness platform so that when we wished to change from male treatment to female treatment we altered the position of the coil from end to end.

In our next experiment we placed the Southern Pole surface of a long flat bar magnet against the outside of the coil to energize it, and then we found that it was no longer necessary to turn the coil around and that both male and female got the same measure of treatment under this system.

In some cases the tests showed that with some radionic equipment if a person is badly polarised and their witness is placed on the machine that was not correctly functioning, that it tended to deplete the person of their etheric energies rather than boost them up. Under this manner the 'black boxes' could prove to be life threatening over a long period. It would work just like a 'black magic' incantation that was designed to depolarise a human body and bring on ectoplasmic depletion causing debilitating health conditions where one may finally succumb to some simple virus, such as influenza or botulism, such was the effect.

The same principles apply in spiritual healing or zone therapy, shiatsu, acupuncture, etc., for if the polarity is poor, little can be expected to happen.

In many cases when such efforts fail, the practitioners will often use the excuse that either the patient had no faith or that the healer did not have the correct rapport with the patient. These people involved with this work blame everything but themselves for the nil results. Such things as 'God failed us' or there was too much karma in the client to bypass, or many other foolish inanities, not knowing that in most cases that the real reason is that they are not trained correctly to do the job in the first place.

Our biggest challenge is getting the message across to these people in order to help them and further the cause of radionics, for when one dares to suggest that they are overlooking some important principle in their work, they tend to become aggressive or give one a rather condescending or patronising look, and continue to carry on in the same ignorant way.

The human body is much simpler to heal than most people imagine, providing one knows the laws involved with good and bad health. We have seen remarkable things take place within the field of human illnesses in a matter of hours, purely by continually polarising the patient. This is a very important function to know about in order to help someone who has just suffered the traumatic shock of a major operation that in most cases completely reverses the body polarity.

It is possible that when tests were conducted with radionic equipment initially and it worked, it was more good luck than good training. When the tests appeared to fail it may have been solely due to the lack of knowledge about the working of the chakras. There is one thing we know for sure and that is that we have never seen a sick person who had all their chakra points functioning correctly and we are certainly convinced that bad body polarity indicates the onset of health imbalances if they are not already there. This system of chakra measuring can be a good type of general diagnostic information for it can direct the investigator to the area related to the malfunctioning chakra point.

It was also found in our experiments that people who took homoeopathic aids received little help from them if they were in a state of poor polarization. We are certain that correct body polarity is the first step to be looked at on the road to good health. It is a principle worth learning about to all those engaged in the field of health work.
