

General Rules

- Due date is 17 January 2003, Friday and **not subject to postpone**.
- Late submission is **not** allowed.
- There is **no** teaming up. The homework has to be done/turned in individually.
- In case of cheating, all parts involved (source(s) and receiver(s)) get zero.
- You will submit your homework electronically and also you are supposed to return a hard copy of your programs to our office (A-401). To submit your homework electronically you will use `submit371` command through a tar archive file (`hw4.tar`). This file will contain your program source codes
- In your program codes, you are required to write comments that describe your code.

Homework

1. Write a Matlab function to implement Gauss Quadrature Method to calculate a numerical integration of a given function for a given interval.

The function prototype is as follows:

```
function[result] = gauss_quadrature(f, A, B, N)
where  f           The function
       A           Start point of the interval
       B           End point of the interval
       N           Number of gauss points
       result      The approximated result of integration
```

2. Write a script file (`run.m`) that displays the approximate cumulative distribution table for the standard normal distribution using the function defined in Part 1. The true values and the format of the table can be seen in the Appendix part.

In standard normal distribution, $\mu=0$ (mean is 0) and $\sigma=1$ (standard deviation is 1), so to obtain the cumulative distribution table, for each z value you must calculate the numerical value of the following formula.

$$\int_0^z \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}} dz + 0.5$$

You may notice that we did not put any restriction to number of gauss points. You should try different values for number of gauss points (up to 8) and examine your results. In your script file, use the value which gives closest results to the true values given in the Appendix.

3. Prepare a report for this homework containing the following sections:
- Source code of Gauss Quadrature Method written in Part 1.
 - The table you obtained by running `run.m`
 - Comment on your results you obtain in Part 2 wrt. the true values given in the Appendix.

APPENDIX

TABLE V
Cumulative distribution: Standard normal (continued)
