

Build an **obstacle-avoiding robot** using an **ESP32 DevKit V1** and an **HC-SR04 Ultrasonic Distance Sensor**, you will need a few more components so the robot can **move and change direction** when it detects an obstacle.

---

## 1 Components Required

- **ESP32 DevKit V1**

- **HC-SR04 Ultrasonic Distance Sensor**

- **L298N Motor Driver Module**

- **DC Gear Motors (2 for left and right wheels)**

Robot chassis with wheels (2WD Two Wheel Drive DIY Kit)

- Battery pack (7.4V–12V)
- Jumper wires

---

## 2 Basic Working Principle

The robot follows this logic:

1. **Ultrasonic sensor measures distance**
2. If **distance > 20 cm** → robot moves **forward**
3. If **distance < 20 cm** → robot **stops**
4. Robot **turns left or right**
5. Then continues moving forward again

So the robot **automatically avoids obstacles**.

---

## 3 Connection Overview

### Ultrasonic Sensor → ESP32

Sensor Pin	ESP32
VCC	5V
GND	GND
TRIG	GPIO 5
ECHO	GPIO 18

---

### Motor Driver → ESP32

L298N Pin	ESP32
IN1	GPIO 26
IN2	GPIO 27
IN3	GPIO 14
IN4	GPIO 12

Motors connect to **OUT1**, **OUT2**, **OUT3**, **OUT4** of the driver.

---

## 4 Basic Obstacle Avoiding Robot Code

```
#define TRIG_PIN 5
#define ECHO_PIN 18

#define IN1 26
#define IN2 27
#define IN3 14
#define IN4 12

long duration;
float distance;

void setup() {
  Serial.begin(115200);

  pinMode(TRIG_PIN, OUTPUT);
  pinMode(ECHO_PIN, INPUT);

  pinMode(IN1, OUTPUT);
  pinMode(IN2, OUTPUT);
```

```

    pinMode(IN3, OUTPUT);
    pinMode(IN4, OUTPUT);
}

void loop() {

    digitalWrite(TRIG_PIN, LOW);
    delayMicroseconds(2);

    digitalWrite(TRIG_PIN, HIGH);
    delayMicroseconds(10);
    digitalWrite(TRIG_PIN, LOW);

    duration = pulseIn(ECHO_PIN, HIGH);
    distance = duration * 0.034 / 2;

    Serial.println(distance);

    if(distance > 20) {
        forward();
    }
    else {
        stopRobot();
        delay(500);
        turnRight();
        delay(500);
    }
}

void forward() {
    digitalWrite(IN1, HIGH);
    digitalWrite(IN2, LOW);
    digitalWrite(IN3, HIGH);
    digitalWrite(IN4, LOW);
}

void stopRobot() {
    digitalWrite(IN1, LOW);
    digitalWrite(IN2, LOW);
    digitalWrite(IN3, LOW);
    digitalWrite(IN4, LOW);
}

void turnRight() {
    digitalWrite(IN1, HIGH);
    digitalWrite(IN2, LOW);
    digitalWrite(IN3, LOW);
    digitalWrite(IN4, HIGH);
}

```

---

## 5 Robot Behavior Example

Distance	Robot Action
----------	--------------

<b>Distance</b>	<b>Robot Action</b>
40 cm	Move Forward
25 cm	Move Forward
15 cm	Stop
15 cm	Turn Right
30 cm	Move Forward again

---

## 6 How It Works Internally

- 1  **HC-SR04 Ultrasonic Distance Sensor** measures distance
- 2  **ESP32 DevKit V1** processes the data
- 3  **L298N Motor Driver Module** controls the motors
- 4  Motors move the robot in different directions

Understanding **ESP32 pins** becomes easy if you group them by **purpose instead of memorizing all numbers**. I'll explain the important pins of the **ESP32 DevKit V1** and give you **simple tricks to remember them**.

---

## 1 Power Pins

These supply power to the board.

Pin	Meaning	Use
<b>3V3</b>	3.3 Volt output	Power sensors
<b>5V / VIN</b>	5 Volt input	Power ESP32 from battery
<b>GND</b>	Ground	Common return path

 **Easy memory trick:**  
“**3-5-G**” → **3.3V, 5V, Ground = Power group**

---

## 2 GPIO Pins (General Purpose Pins)

GPIO means **General Purpose Input Output**.  
These pins can **read sensors or control devices**.

Examples:

Pin	Use Example
GPIO2	LED
GPIO4	Sensor input
GPIO5	Trigger pin
GPIO18	Echo pin
GPIO23	Output

Example:

```
pinMode(23, OUTPUT);  
digitalWrite(23, HIGH);
```

 **Memory trick:**  
Think **GPIO = “General Pins for Everything”**

---

## 3 UART Pins (Serial Communication)

Pin	Function
<b>TX (GPIO1)</b>	Transmit data
<b>RX (GPIO3)</b>	Receive data

Used for:

- Serial monitor
- Bluetooth modules
- Communication between devices

**Memory trick:**

**T** → **T**alk (**T**ransmit)

**R** → **R**eceive

---

## 4 PWM Pins (Motor / LED control)

PWM = **P**ulse **W**idth **M**odulation

Used for:

- Motor speed control
- LED brightness
- Servo motors

Common PWM pins:

GPIO 2, 4, 5, 18, 19, 21, 22, 23

**Memory trick:**

**“2-4-5 group and 18-23 group”**

These are **safe pins for outputs**.

---

## 5 I2C Communication Pins

Used for:

- LCD
- OLED
- Sensors

**Pin Name**  
**GPIO21 SDA**  
**GPIO22 SCL**

**Memory trick:**  
**21 → SDA**  
**22 → SCL**

Just remember **21-22 pair**.

---

## 6 SPI Communication Pins

Used for:

- Displays
- SD cards
- Fast sensors

**Pin Function**  
GPIO23 MOSI  
GPIO19 MISO  
GPIO18 SCK  
GPIO5 CS

**Memory trick:**  
**“23-19-18-5” = SPI group**

---

## 7 Analog Pins (ADC)

Used to read **analog values** like sensors.

Examples:

GPIO 32  
GPIO 33  
GPIO 34  
GPIO 35  
GPIO 36  
GPIO 39

Example:

```
analogRead(34);
```

□ **Memory trick:**  
“32–39 range = Analog sensors”

---

## 8 □ Pins to Avoid □

Some pins cause **boot problems**.

Avoid using for outputs:

GPIO 0  
GPIO 2  
GPIO 15

□ **Memory trick:**  
“0-2-15 = Boot pins”

---

## 9 □ Simple Pin Group Memory Map □

Think of ESP32 like this:

Power → 3V3, 5V, GND

Communication

UART → 1, 3

I2C → 21, 22

SPI → 23, 19, 18, 5

Safe Output Pins

2, 4, 5, 18, 19, 21, 22, 23

Analog

32–39

---

## ☐ Quick Trick Robotics Students Use ☐

For most **ESP32 projects**, remember just this:

Trigger sensor → GPIO5

Echo sensor → GPIO18

LED → GPIO23

I2C devices → 21,22

These pins work **in 90% of beginner projects**.
