

## Section Three : Metals

### Unit Eleven : Basic Chemical Calculations I suggested answer

#### I. The Avogadro's Number, Mole, Formula Mass, Molecular Mass and Molar Mass

☆ For example:

Formula	Term to describe its mass	Molecular or Formula mass
H <sub>2</sub> O	Molecular / Formula	(1) x 2 + (16) x 1 = 18
Ca(OH) <sub>2</sub>	Formula	74
H <sub>2</sub> SO <sub>4</sub>	Molecular / Formula	98
Na <sub>2</sub> CO <sub>3</sub> ·10H <sub>2</sub> O	Formula	286
Na <sub>2</sub> (CO <sub>3</sub> )	Formula	106
C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	Molecular / Formula	180

#### Examples:

- Mass of carbon dioxide =  $7.5 \times (12 + 16 \times 2)$   
= 330 g
- Number of mole of oxygen =  $20 / (16 \times 2)$   
= 0.625
- (i) Molar mass of C<sub>x</sub>H<sub>2x</sub> =  $210 / 2.5$   
= 84 g  
(ii)  $84 = 12x + 2x$   
 $x = 6$   
therefore, the chemical formula = C<sub>6</sub>H<sub>12</sub>

#### Examples:

- Number of mole of Mg =  $2.4 / 24 = 0.1$   
Number of Mg atom =  $0.1 \times 6 \times 10^{23}$   
=  $6 \times 10^{22}$
- (a) Molar mass of Be = 9 g  
1 mole Be atom =  $6 \times 10^{23}$  Be atom = 9 g  
Mass of 1 Be atom =  $9 / 6 \times 10^{23} = 1.5 \times 10^{-23}$  g  
(b) Mass of 1 SO<sub>2</sub> molecule =  $(32 + 2 \times 16) / 6 \times 10^{23}$   
=  $1.06 \times 10^{-22}$  g

## 3. Remark: L is the Avogadro's Number

Substance	Number of mole	Mass (g)	Number of particle
Chlorine molecule (Cl <sub>2</sub> )	2	142	Cl <sub>2</sub> molecules: 2L Cl atoms: 4L
Phosphorus (P <sub>4</sub> )	0.5	62	P <sub>4</sub> molecules: L/2 P atoms: 2L
Sulphur (S <sub>8</sub> )	0.5	128	S <sub>8</sub> molecules: L/2 S atoms: 4L
Sulphur dioxide (SO <sub>2</sub> )	2	128	SO <sub>2</sub> molecules: 2L S atoms: 2L O atoms: 4L
Sodium hydroxide (NaOH)	2	80	Total no. of ions: $2.4 \times 10^{24}$ Na <sup>+</sup> ions: 2L OH <sup>-</sup> ions 2L
Sulphuric acid (H <sub>2</sub> SO <sub>4</sub> )	0.5	49	H atoms: L S atoms: L/2 O atoms: 2L H <sup>+</sup> ions: L SO <sub>4</sub> <sup>2-</sup> ions: L/2
Sucrose (C <sub>12</sub> H <sub>22</sub> O <sub>11</sub> )	0.00833	2.85	C atoms: $6 \times 10^{22}$ H atoms: $(0.1/12) \times 22L$ O atoms: $(0.1/12) \times 11L$
Hydrated copper(II) sulphate (CuSO <sub>4</sub> ·5H <sub>2</sub> O)	0.5	125	H <sub>2</sub> O molecules: 5L/2 Cu <sup>2+</sup> ions: L/2 SO <sub>4</sub> <sup>2-</sup> ions: L/2
Hydrated sodium carbonate (Na <sub>2</sub> CO <sub>3</sub> ·10H <sub>2</sub> O)	2	572	H <sub>2</sub> O molecules: 20L Na <sup>+</sup> ions: 4L CO <sub>3</sub> <sup>2-</sup> ions: 2L

## II. Molar Volume 摩爾體積 for Gases

## Examples:

- Number of mole of carbon dioxide =  $2.2 / 44 = 0.05$   
Volume of carbon dioxide =  $0.05 \times 22.4 = 1.12 \text{ dm}^3$
- Number of mole of hydrogen and oxygen =  $2.24 / 22.4 = 0.1$
- Number of mole of ammonia =  $2.4 / 24 = 0.1$   
Mass of ammonia =  $0.1 \times (14 + 3 \times 1) = 1.7 \text{ g}$

## III. Percentage by mass of an element in a compound

Urea	CO(NH <sub>2</sub> ) <sub>2</sub>	% N = $[28 / (12+16+28+4)] \times 100\% = 46.67\%$
Sodium nitrate	NaNO <sub>3</sub>	% N = $[14 / (23+14+48)] \times 100\% = 16.47\%$
Aqueous ammonia	NH <sub>3</sub>	% N = $[14 / (14+3)] \times 100\% = 82.35\%$
Ammonium sulphate	(NH <sub>4</sub> ) <sub>2</sub> SO <sub>4</sub>	% N = $[28 / (28+8+32+64)] \times 100\% = 21.21\%$
Ammonium nitrate	NH <sub>4</sub> NO <sub>3</sub>	% N = $[28 / (14+4+14+48)] \times 100\% = 35\%$

IV. Empirical formulae 實驗式, Molecular formulae 份子式, Structural formulae 結構式 and Ionic formulae 離子式

B. Using the mole concept to find the formulae of compounds :

e.g.2

Element	Cu	Cl
Mass of element	47.4	52.6
No. of mole	0.746	1.482
Relative no. of mole (Mole ratio)	1	2

The empirical formula =  $\text{CuCl}_2$

If the formula mass is 270, then the formula is  $\text{Cu}_2\text{Cl}_4$ .

If the formula mass is 540, then the formula is  $\text{Cu}_4\text{Cl}_8$ .

e.g. 3

Element	Mg	C	O
Mass of element	28.6	14.3	57.1
No. of mole	1.2	1.2	3.6
Relative no. of mole	1	1	3

The empirical formula =  $\text{MgCO}_3$

e.g. 4

Element	Pb	O
Mass of element	$1.374 - 0.126 = 1.248$	0.126
No. of mole	0.006	0.0079
Relative no. of mole	3	4

The empirical formula =  $\text{Pb}_3\text{O}_4$

e.g. 5

Element	C	H	O
Mass of element	40	6.66	53.33
No. of mole	3.33	6.66	3.33
Relative no. of mole	1	2	1

The empirical formula =  $\text{CH}_2\text{O}$

Let the molecular formula be  $(\text{CH}_2\text{O})_n$

Therefore,  $n(12+2+16) = 60 \Rightarrow n = 2$

The molecular formula =  $\text{C}_2\text{H}_4\text{O}_2$

e.g. 6

(a) (i) mass of H =  $9 \times (2/18) = 1\text{g}$

(ii) mass of C =  $5.8 - 1 = 4.8\text{g}$

(iii)

<i>Element</i>	<b>C</b>	<b>H</b>
<b>Mass of element</b>	<b>4.8</b>	<b>1</b>
<b>No. of mole</b>	<b>0.4</b>	<b>1</b>
<b>Relative no. of mole</b>	<b>2</b>	<b>5</b>

The empirical formula =  $\text{C}_2\text{H}_5$ 

(b) (i)  $1.2/M = 0.5/24 \Rightarrow M = 57.6$  (molecular mass)

(ii) Let the molecular formula =  $(\text{C}_2\text{H}_5)_n$

$n(24+5) = 57.6 \Rightarrow n \sim 2$

Molecular formula =  $\text{C}_4\text{H}_{10}$

## VI. Calculations Using Equations

### A. Calculations from Equations — Reacting Masses and Volumes

#### Examples:

1. Number of mole of sodium hydrogencarbonate =  $3.36 / 84 = 0.04$

Number of mole of carbon dioxide =  $0.04 / 2 = 0.02$

Maximum volume of carbon dioxide =  $0.02 \times 22.4 = 0.448 \text{ dm}^3$

Number of mole of HCl =  $2 \times 0.025 = 0.05$

Number of mole of  $\text{H}_2$  =  $0.05 / 2 = 0.025$

Volume of hydrogen =  $0.025 \times 24 = 0.6 \text{ dm}^3$

(a) Number of mole of magnesium =  $2.43 / 24.3 = 0.1$

Number of mole of magnesium oxide = 0.1

Mass of magnesium oxide =  $0.1 \times (24.3 + 16) = 4.03 \text{ g}$

(b) Number of mole of oxygen =  $1.28 / 32 = 0.04$

Number of mole of magnesium = 0.1

Magnesium is in excess!!!

Number of mole of magnesium oxide =  $0.04 \times 2 = 0.08$

Mass of magnesium oxide =  $0.08 \times (24.3 + 16) = 3.224 \text{ g}$

4. Number of mole of sodium carbonate =  $5.3 / 106 = 0.05$   
 Number of mole of HCl =  $2 \times 0.04 = 0.08$   
 Sodium carbonate is in excess!!!  
 Number of mole of carbon dioxide =  $0.08 / 2 = 0.04$   
 Volume of carbon dioxide =  $0.04 \times 24 = \mathbf{0.96 \text{ dm}^3}$
5. Number of mole of copper(II) oxide =  $15.9 / 79.5 = 0.2$   
 Number of mole of hydrogen =  $0.2$   
 Mass of copper =  $0.2 \times 63.5 = \mathbf{12.7 \text{ g}}$
6. Number of mole of sulphuric acid =  $3 \times 0.025 = 0.075$   
 Number of mole of hydrated copper(II) sulphate =  $0.075$   
 Molar mass of hydrated copper(II) sulphate =  $249.5 \text{ g}$   
 Mass of hydrated copper(II) sulphate =  $0.075 \times 249.5 = \mathbf{18.1725 \text{ g}}$
7.  $\text{NH}_4\text{Cl} + \text{NaOH} \longrightarrow \text{NH}_3 + \text{NaCl} + \text{H}_2\text{O}$   
 $2\text{NH}_3 + \text{H}_2\text{SO}_4 \longrightarrow (\text{NH}_4)_2\text{SO}_4$   
 Number of mole of ammonium sulphate =  $2.64 / 132 = 0.02$   
 Number of mole of ammonia =  $0.02 \times 2 = 0.04$   
 Number of mole of ammonium chloride =  $0.04$   
 Mass of ammonium chloride =  $0.04 \times 53.5 = \mathbf{2.14 \text{ g}}$

## B. Calculations from Equations — Reacting gaseous volumes

### Examples:

1.  $\text{CH}_4 + 2\text{O}_2 \longrightarrow \text{CO}_2 + 2\text{H}_2\text{O}$   
 (a) Volume of methane =  $40 \text{ cm}^3$   
 Volume of oxygen =  $40 \times 2 = \mathbf{80 \text{ cm}^3}$   
 (b) Volume of gaseous products at r.t.p. ( $\text{CO}_2$ ) =  $\mathbf{40 \text{ cm}^3}$
2.  $2\text{H}_2 + \text{O}_2 \longrightarrow 2\text{H}_2\text{O}$   
 Volume of  $\text{H}_2$  =  $150 \text{ cm}^3$       Volume of  $\text{O}_2$  =  $100 \text{ cm}^3$   
 Oxygen is in excess!!!  
 Volume of  $\text{O}_2$  used =  $150 / 2 = 75 \text{ cm}^3$   
 Volume of  $\text{O}_2$  remained =  $100 - 75 = \mathbf{25 \text{ cm}^3}$
3. Volume of  $\text{CO}_2$  =  $50 - 20 = 30 \text{ cm}^3$   
 Volume of  $\text{O}_2$  remained =  $20 \text{ cm}^3$   
 Volume of  $\text{O}_2$  reacted =  $70 - 20 = 50 \text{ cm}^3$   
 $\text{C}_x\text{H}_y + (x+y/4)\text{O}_2 \longrightarrow x\text{CO}_2 + (y/2)\text{H}_2\text{O}$   
 From the volume, get  $x = 3$        $x + y/4 = 5 \Rightarrow y = 8$   
 Therefore, the molecular formula =  $\mathbf{\text{C}_3\text{H}_8}$
