

On the Quantization and Relativization

Saurav Dwivedi

12 March 2005

The Quantization and Relativization are one of the most recognized bridges of twentieth century which are essential for all modified theorists to cross with their heads, that is, their own hypothesis and analysis despite in its counterpart, an essential modification of Quantization and Relativization of their aspect.

It is this and that modification which implies us to fill never to be filled gaps in our understanding of nature which is in the need of such modification, that is, the Darwinian evolution of the existence of our knowledge of nature with its ever increased existency.

It is not every century when such bridges are built. There are one of the few outstanding theorists who in their greatest achievements originate such revolutionary bridges. A number of great theorists fill the never to be filled gaps in the bridges with their quest. More the gap is filled more the bridge seems incomplete. There is only one way to win that theorists in their greatest achievement try to fill such never to be filled gaps and they originate the new revolutionary bridges to make an occasion to fill the gaps left. Humanity will always enjoy the highest spiritual values provided by theorists on the eve of making bridges and sacrificing everything to fill the never to be filled gaps.

We are grateful of having highest spiritual values (science art and literature) provided by the great veterans who visit our world for a short occasion to provide us joy and happiness of appreciating the great values.
