CONSULTATION REPORT

C.T. SCAN OF THE CHEST

Contrast study of the chest shows a huge pulmonary mass in the left lower lobe measuring 9.4 x 6.4 cm. This is attached to the hilum and pleura.

Nodular densities are seen in the hilum.

Acinar infiltrates are noted in the left upper lobe.

Fibrotic densities are seen in both apices.

The heart is slightly enlarged.

No lytic changes demonstrated.

IMPRESSION:

PULMONARY MASS, LEFT LOWER LOBE, MALIGNANCY IS HIGHLY CONSIDERED. ATTACHMENT TO THE HILUM AND PLEURA IS DEMONSTRATED.
LEFT HILAR LYMPHADENOPATHY.
FIBROSIS, BOTH APICES.
